Take Off Over-weight

Modern science says sugar supplies energy that lets you carry on with less food and safely reduce weight.

WRIGLEY'S is pure chicle, sugar and flavor. Chewing the chicle dissolves the sugar and releases the flavor.

In this pleasant way you get needed body fuel and reduce the pounds.

Weigh off with WRIGLEY'S CJ41

CHOOSING A RADIO SET

In selecting a good radio set there are three fundamentals to consider. It must be sensitive. That is, it must bring in distant stations. It must be selective. That means you must get clear reception without interference from other stations. You must have tone quality. That is reception exactly as it goes on the air at the broadcasting station. These three qualities have been developed to a greater degree than has heretofore been possible in the New Victor-Syncronous Radio.

Are you appreciative of the greatest of these—tone quality?—those fine shades of distinction between just a receiving set and a real musical instrument. The New Victor reproduces all the dainty charm of the artists both vocal and instrumental. All the overtones, all the undertones, nothing omitted. It is radio refined—not just radio. The New Victor Micro-Syncronous Radio set is one you will always love for its sensitivity, selectivity, smart appearance and its marvelous and incomparable tonal effects. Ten tubes. Wonderful volume and no distortion. The price is equally marvelous, only $255.00. The Radio-Electrola $375.000. Sold on easy extended payments. Phone No. 6 and arrange for a free demonstration in your home. McRae, Bros., Ltd.—Advt.

ORE STRIKE SMITHERS

Humming Bird Group Vein Examined by Engineer Who is Pleased With it

SMITHERS, Oct. 9:—A new ore strike of considerable general interest was recently made on the Canary claim of the Humming Bird group on Hudson Bay Mountain by employees of the Duthie mine. This property is under option to the Duthie people. They have shown up by open cuts and stripping for a length of about 400 feet an apparently continuous body of ore containing high grade galena and zinc two feet wide.

F. P. Cuddy, assistant to Douglas Lay, resident engineer, visited the property this week and was much pleased with the showing. He took samples of high grade which at that point was two feet wide and undoubtedly the ore will assay high.

News of the Mines

AROUND PRINCE RUPERT

New Mineralized Area on American Creek; Ankh at Stewart Believed Early Shipper; Blackhill Showing Up Well

A new mineralized area of major mportance is believed to have been discovered at the head of American Creek in Stewart camp, on which forty claims have been located by D. Kimball for himself and associates, including also a group of twelve claims for the Northern Prospecting Syndicate. Kimball made the discovery some weeks ago, but continued prospecting in an effort to determine the extent of the vein system which was found to cover a large area, the main veins following the northerly strike of the mountain range with intersecting east-west ledges. Assays show the claims to be of commercial importance. The amount of float ore lying below outcrops on the mountain side is extensive and nidicates important ore bodies in addition to what has been found in place. There are two series of veins—one carrying silver lead ores and the other copper ore. Values average up to 50 ounces in silver in the silver-lead veins and four per cent copper in the copper veins. The ore is somewhat similar to the occurences on the Mountain Boy, Maybee and other claims lying on the same mountain range 10 miles north of the older claims. There is reason to believe that the new discovery is the same "Arizona Copper," found by members of a placer expedition to the upper Naas in 1898. The then discoverer stated that had his find been in Arizona he would have been a millionaire. In later years several prospectors attempted to relocate the find, which was known to lie above the glacier, but none of them went far enough up the creek or high enough up the mountain.

The Ankh, situated about three miles north of the mouth of the Georgia River on Portland Canal, looms up as the probability of another shipping mine in that field. The property consists of a group of 20 claims which was bonded last spring by Edward G. Brown of Vancouver from James Lydden discoverer and locator. The second payment on the bond was made last week. Surface prospecting was carried on throughout the summer on the group. Now Albert Peterson, recognized as a capable hard rock miner, has taken charge of development which will be carried on throughout the coming winter. McKenzie and Davies, Vancouver financial concern, has underwritten sufficient of the treasury stock to finance the winter's work, the result of which will largely determine the character and capacity of transportation necessary to take the ore down to the beach. At the top showing, 22000 feet above sea level, mineralization is from 50 to 80 feet wide, with a pay streak from 15 inches to two feet in width, of chalcopyrite ore which carries from 4½ to 5 per cent copper and some gold and silver values. Lower down the mountain and 1250 feet nearer the beach an open cut shows a strong vein carrying from 20 to 25 per cent copper. In the spring, it is probable that some kind of a tramline and wharf will be required.

The Blackhill Mining Co.'s property is shaping up well and bears many earmarks of becoming an important producer. The main tunnel is being driven ahead, two shifts being employed, and it is expected that, within another one hundred feet, the tunnel will arrive at the intersection being driven for. A large shoot of high grade galena is being opened up. Control of the Blackhill Mining Co. is under option to the Marmot Metals Holding Syndicate by whom the present work is being done. John Haahti is mine superintendent.

Operations on the George Enterprise property have been suspended for the winter. During the past summer, machinery was installed preparatory to carrying out more extensive development. The work was mostly confined to tunnelling and the results are reported to have been satisfactory. The source of the high grade float fund on the property was located and the vein drifted upon for 50 feet. The vein was narrow to start with but widened out considerably and exposed a good grade of ore. The main tunnel, driven to intersect a surface showing of chalcopyrite carrying $16 in gold, crossed the zone in depth and also cut a second vein which holds forth promising prospects. An average of 16 men were employed on the property during the summer, the work being under supervision of Stewart Batten and associates, consulting engineers.

G. R. Bancroft, well known consulting mining engineer, is a passenger aboard the Prince Rupert today bound from Vancouver to Stewart.
