AROUND PRINCE RUPERT

Hastings Arm Strike Rich; Porter Bonds Kenneth Group at Stewart; Marmot Engineer Promising

The recent discovery of gold ore on the Elkhorn group at Hastings Arm gives promise of being the richest ore find ever made in Northern British Columbia. Returns from samples that were recently assayed gave values of $8441 in gold, and, in addition to the gold, the ore also carries silver and lead. The owners are busily engaged in stripping the vein and plan to take out as much ore as possible this fall before snow conditions render surface work impossible. Those who have visited the property say that the possibilities for a large tonnage of rich ore are excellent.

C. H. Hayes, Vancouver mining engineer, recently inspected the Mohawk mining property at Alice Arm. He was greatly interested in the possibilities of the camp with which, he said, he would keep closely in touch.

The Kenneth group of seven claims near the head of the south fork of Glacier Creek at Stewart has been bonded by Clay Porter from the owners, H. P. Gibson and Louis Legge. The Kenneth was formerly known as the Mobile property, having been developed in a manner in 1920 by the Mobile Mining Co. under the supervision of Roy L. Clothier. During the course of this work, considerable ore was extracted and a shipment made to Swansea, Wales, the result of which was said to be extremely satisfactory to the management. Mr. Porter and Dalby B. Morkill, B.C.L.S., lay out a new program of development for the property. An excellent showing was made this year by a short tunnel driven on one of the veins by the owners, two assays on fourteen inches of ore giving respectively 987 and 262 ounces in silver, a considerable amount of the silver being visible in native form. Next season, it is expected, an aggressive development campaign will be undertaken by the new interests.

With about three hundred feet of underground work done, development work on the Marmot Engineer property (Portland Canal) has been temporarily suspended at an interesting point, the lead which was the tunnel's objective having been encountered. The compressor was badly in need of overhauling when the lead was reached but, nevertheless, the manager, George H. Bunn, crowded it in an attempt to crosscut to the opposite wall before suspending operations. The vein, however, proved too large for this to be done and, after crosscutting twenty-one feet, suspension became imperative. The width of the vein cannot be foretold from surface indications, parts of the surface exposures being hidden by sediments and surface wash. Conditions underground are, however, as expected, and furnish a source of gratification to the management. The vein is separated from the country rock by a substantial layer of talc, the vein itself being banded into various sections, each distinct in itself, but all associated into one big body and all appearing to form a good milling product. Samples of the ore show white quartz matrix, carrying galena and chalcopyrite, the galena being more prevalent than appears on the surface. It is the intention, when the compressor has been put into condition, to drift on the vein to get under a showing of solid chalcopyrite which has been partially developed on the surface and which appears to be the outcrop of a strong shoot of shipping ore. Because of its proximity to the beach, which is only six miles distant, being connected with a pack train and wagon road, favorable shipping rates have been secured.

Diamond drilling on the Atlas property in the vicinity of the George Copper has been suspended for this season without the contract being finished. Until the work is completed, the engineers in charge of the operations, Messrs. Stewart, Batten and associates, have nothing to report as to the results of the drilling.

Following the recent visit to that camp of the associate editor, A. G. Langley, M.E., M.I.M.M., there has been much in the Financial News about the Stewart field. The Big Missouri region in the Bear River valley is described in detail. The Premier mine is also described and Mr. Langley is of the opinion that ore bodies there are not going to be depleted as fast as might have been expected.

Local Concern Gets Contract

Pacific Stevedoring Co. to Build New Floats and Approach at Port Essington

The Pacific Stevedoring & Contracting Co. of this city has been awarded the contract for a new float and approach by the federal department o fpublic works. The work was provided for in this year's estimates at Ottawa. Construction will start shortly.

T. B. Campbell, engineer in charge of totem pole preservation work in the interior for the Canadian National Railways, arrived in the city from Hazelton on yesterday afternoon's train.

EXTENSIVE WOOD TESTS

At the Forest Products Laboratories of Canada Department of the Interior, 70,000 tests have been made to date on one project: "The Physical and Mechanical Properties of Canadian Woods."

FELDSPAR IN CANADA

All the feldspar mined in Canada is of the potash variety known as orthoclase or microcline. Soda feldspar (albite) is known to occur but there is little demand for this variety and none is mined.

Acts Like a Flash!

THOUSANDS of people follow the practice of taking a few sips of Buckley's Mixture before and after going to a theatre or any public gathering. "Buckley's" contains antiseptics and germicides that "act like a flash", killing the germs that find their way into the mouth and throat from people coughing and sneezing. Buckley's Mixture is just as valuable as a preventive of colds, coughs, sore throat, flu, bronchitis, as it is to give speedy relief for a cough or cold.

Two sizes: 75c (40 doses) —40c (16 doses). At all druggists.
