**DOUBLE BILL  
AT CAPITOL**

"Freedom of the Press" and  
"Honeymoon Abroad"—Ro-  
mance, Thrills, Comedy

The intensely interesting and dramatic atmosphere that is bound up with life on a newspaper has been brought to the screen in the greatest story of journalism ever made. It is titled "Freedom of the Press" and is a film version of an original screen story by Peter B. Kyne. "Freedom of the Press," which is a Universal picture, will come to the Capitol Theatre tonight.

A battle between the cruel forces of the sword and the mighty power of the pen is the dramatic theme upon which the picture is based. The underworld of a big city is the sword and the columns of a large daily paper is the pen. Not even the love of the underworld king's ward and the son of the newspaper publisher can bring amity between the two forces before the entire city is rocked by the titanic struggle that finally crushes the outlawed group.

Lewis Stone appears in the starring role of the power behind the underworld. It is the greatest characterization this veteran actor has ever given and one of the finest portrayals of the year.

"Honeymoon Abroad" is a very distinct and unusual comedy not only for its laughable situations but for its unique mixture of thrill scenes with the comedy element.

The story carries a well defined plot in which a pair of honeymooners are chaperoned by the bride's mother, who feels that it is indelicate for her darling to be out alone with a man, even if he happens to be her husband. The schemes that the young couple devise to get rid of mamma and steal an unchaperoned kiss bring about some most comical situations.

**DEVELOPMENT  
SCIENCE STUDY**

Richard Pillsbury Addresses Rotary Club on Fascinating Subject

"The development of scientific study" or as he put it "How Scientists Got that Way," was the subject of an extremely interesting address by Richard W. Pillsbury, B.A. of this city to the Rotary Club at their luncheon yesterday. In it he traced the gradual development of scientific study from the earliest days showing how superstition disappeared before knowledge until people today were able to formulate a systematic philosophy of the universe based on the results of their investigations, investigations which anyone with the necessary ability and technique is able to follow.

Mr. Pillsbury distinguished between fact and theory and showed that effect followed cause. There were the exact sciences such as mathematics and the inexact sciences which were based on fact but partly the result of theorizing. In the latter it was found in biology, in which he was particularly interested, that law and order prevailed. There was a reason behind everything. He mentioned the work of Aristotle, the first known scientist, who has investigated and recorded what he saw. For many years learning was confined to the monasteries and men who claimed they had found anything new were persecuted. The first man who thought he saw spots on the sun was declared mad because somebody before him had declared the face of the sun to be immaculate.

The speaker went on to tell of the various steps in the study of anatomy and physiology and of the difficulties under which they worked. At last scientists came to the point where they could say "Never believe any authority until proved." Harvey's theory of the circulation of the blood was disbelieved at first, although later it was accepted. Then came the discovery of the capillaries through the microscope and the differentiation between veins and arteries.

Thoroughness Necessary  
Mr. Pillsbury showed that the scientists who had left a name in the world and whose work lasted were those who had been thorough in their investigations. Such

a man was Darwin who had gone as naturalist on a four or five year expedition and then worked over the discoveries for 20 years before announcing them to the world. At the same time Albert Wallace, who had been less thorough in his work yet had arrived at exactly the same conclusions, gave his work to the world. Other men such as Smith and Pasteur had contributed greatly to the advancement of science.

Telling of his own work which he was only beginning, Mr. Pillsbury said he had taken a course at the university and was particularly interested in plant pathology. He was studying bacteria particularly the fungi which prey upon animals. The study of this subject in relation to fish was his special work and he was acquiring the technique to carry it on.

He was thanked for his address by President Bryant.
